1 Introduction

The Property Transfer XML extract provides one standard format for use by multiple recipients. It includes virtually all of the data reported on the PTT-172 form and PTT-175. The only significant exception is that **SSNs and contact information are not included**. This data is as reported by the taxpayers and accepted by the Tax Department. The Department presents it as-is.

The Extensible Markup Language (XML) format provides tagged data elements in a hierarchical structure consistent with the W3C XML 1.0 Recommendation ([Extensible Markup Language \(XML\) 1.0 \(Fifth Edition\)](https://www.w3.org/TR/xml/)(<https://www.w3.org/TR/xml/>)). The extraction process requires two dates as input parameters: a begin date and an end date. All returns that were posted (received and processed by the department) on or after the begin date and on or before the end date are included in the extract.

This documentation is a dynamic resource that will update over time to reflect changes to the Property Transfer Tax. To make tracking these changes easier, each version of the documentation will be accompanied by a date in the file name. This date will serve as a reference point, allowing users to identify if updates have occurred. It will be important to verify that you always have the most up to date documentation as the code values within these documents may have been updated. The other file with the PTT Decodes will also be accompanied by a date in the file name. By including these dates in the file names, we aim to provide transparency and clarity regarding the evolution of the documentation, making it easier for users to stay informed and access the most up-to-date content.

2 Extract Specifications

2.1 File Name

Extract files are named according to the following pattern:

PT<begindate>_<enddate>.xml

The embedded dates are the extract parameters of “beginning posting date” and “ending posting date” in yyyyymmdd format. These dates define the range of returns that are included in the extract. For example, an extract file covering returns **posted** to the Department system in January 2023 is named: PT20230101_20230131.xml

2.2 File Description

The extract file contains an XML document with the following general structure:

<PropertyTransferExtract> This contains the posting dates of returns in the file.

<List_formData>

<formData> Individual return data here. Tag occurs at least once and repeats for each form included
<formHeader> Data from main PTT-172 form.

<buyerSellerList>

<buyerSeller> PTT-175 data (additional Buyers & Sellers). Tag may occur zero to many times

</formData> This would be the second return data. There is one for every return in the file.

</List_formData>

</PropertyTransferExtract>

The file contains a variable number of forms. Each <formHeader> section contains data from one PTT-172 form. The <buyerSeller> sections contains the data from one of entries on the PTT-175. Each additional buyer or seller will display individually here. Note that the indentation and multiple lines shown above are for presentation purposes. In general, “whitespace” characters (space, tab, return, newline) outside of data tags are not significant in XML and are not necessarily included in the extract file.

Also note that the tag names in XML are case-sensitive: formData is not the same as FormData.

2.3 Layout Details

The following table lists the field names displayed from the data. If the Report Name is blank in that section, it means that the item is unique to the XML data layout/structure and does not contain any specific return information. The second column notates where on the form this is located. If there is a blank in the column this indicates there is no corresponding line on the form. The third column has the name and display from the xml. The fourth column gives any relevant information related to that data point. The fifth column displays how that data point should be formatted. The blanks in the format column mean that there are no restrictions on the data.

The Format column identifies the data format used for data values. Some conventions

- “9” represents a digit
- “X” represents any character
- “yyyy-mm-dd” represents a date

Note that numbers that may have decimal places include the decimal point in the data value.

The Occurs column specifies how many occurrences of the tag are possible:

- “1” means the tag is required and must occur exactly once at each point in the hierarchy where it may occur.
- “0..1” means the tag is optional: it may occur once or not at all at each point in the hierarchy where it may occur.
- “1..*” means the tag occurs at least once and may occur any number of times.
- “0..*” means the tag is optional but may occur any number of times
